PLATFORM OVERVIEW

LogiCore

One connected platform to move, store and protect temperature-sensitive goods.

Warehouses · Trucks · Live tracking · Cold-chain monitoring · Courier network

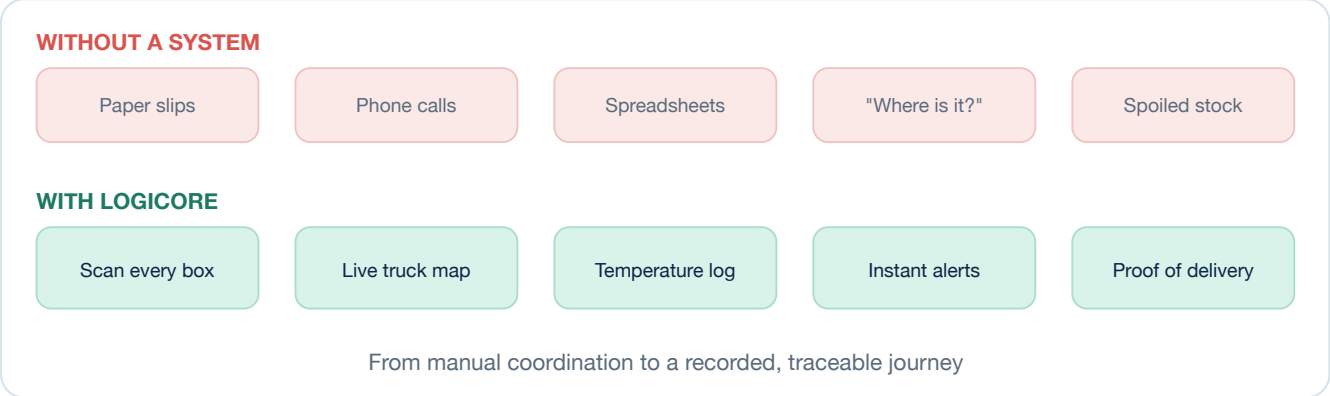

Product overview for prospective partners
October 2026 · Confidential

01 · THE IDEA

Cold-chain goods are fragile. The paperwork around them shouldn't be.

Medicines, vaccines, dairy and fresh produce must stay inside a temperature range from the factory shelf to the customer's door. Today that journey is managed with phone calls, paper slips and spreadsheets — so when a box goes missing or a truck runs warm, nobody knows *where* or *when* it happened.

LogiCore replaces that with a single system: every box is scanned at every hand-off, every truck is tracked, and every step is recorded.

From manual coordination to a recorded, traceable journey

What we are building, in one picture

Know what you hold

Warehouses with scanned boxes and pallets, so stock and location are always exact.

Know where it is

Trucks and drivers tracked live on a map, with every trip and stop recorded.

Know it stayed cold

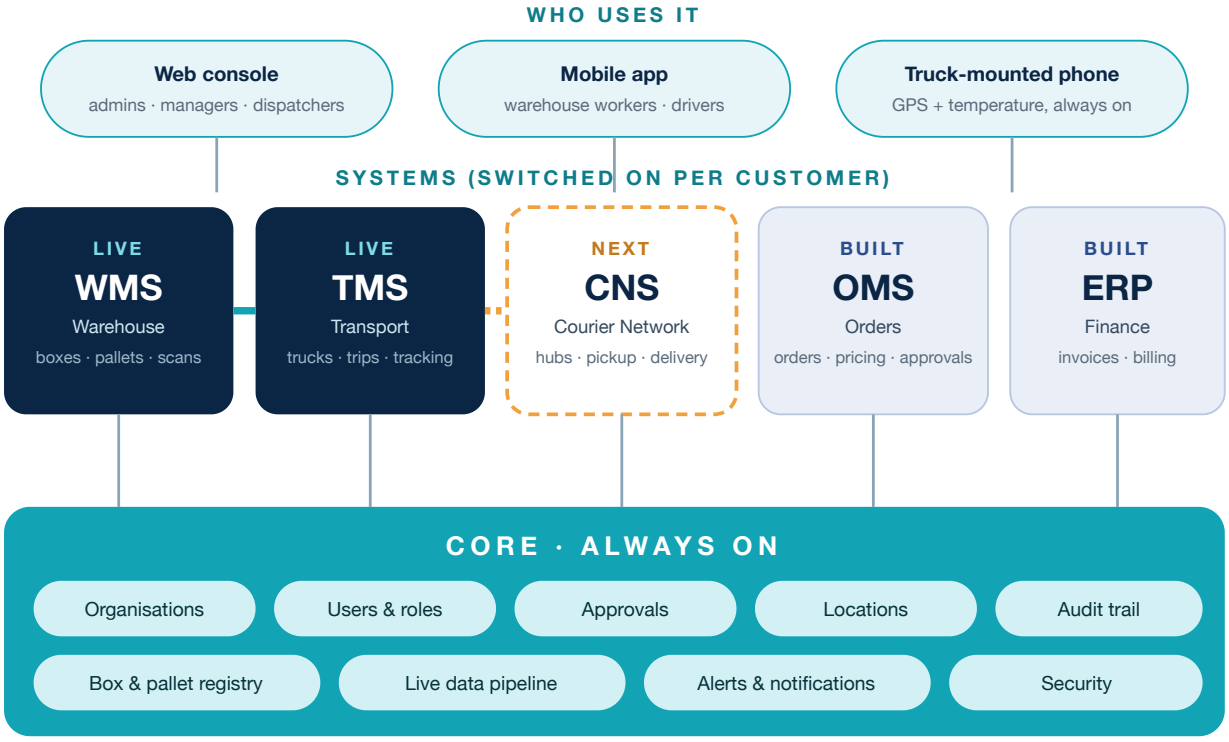

Temperature measured inside the truck for the whole journey, with alerts when it drifts.

The core promise: a complete, tamper-evident record of every box — who handled it, which truck carried it, where it was, and what temperature it travelled at.

02 · THE PLATFORM

One foundation, switchable systems

LogiCore is built as a shared core with separate **systems** on top. Each customer organisation gets only the systems it needs; they switch on or off per organisation and work together automatically when combined.

LogiCore architecture — apps on top, switchable systems in the middle, shared core underneath

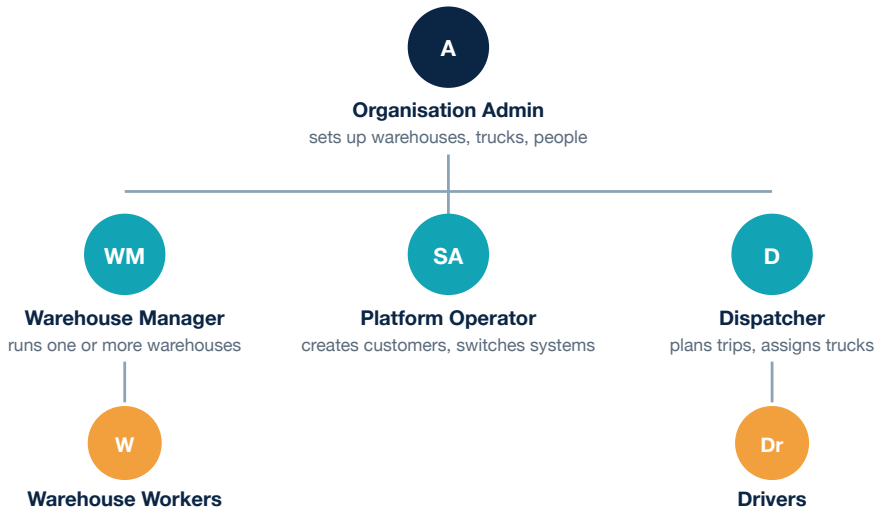

Why this shape matters

- **Start small, grow naturally.** A customer can begin with trucks only, add warehouses later — no migration.
- **Systems cooperate.** With WMS and TMS both on, a warehouse dispatch becomes a truck trip automatically.
- **Every organisation is isolated.** One customer can never see another's data.
- **One login, one record.** People, locations and boxes are defined once and shared by every system.

03 · PEOPLE & APPS

Built around the people who do the work

Each role sees only what it needs. Office staff manage and monitor from the web console; people on the floor and on the road use a simple, large-button mobile app.

Roles and reporting lines — managers build their own teams

Controlled onboarding

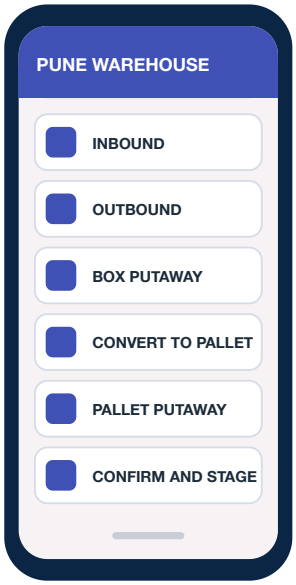

Adding people is deliberate. An admin adds anyone directly; a manager's request for a team member goes to the admin for approval first. Accounts are never deleted — only suspended — so history always stays intact.

Simple sign-in

Staff sign in with a plain user ID (e.g. *firstname.lastname*) — no email address needed, which suits shop-floor and driver users.

Built for the floor

Large, high-contrast buttons, camera or hardware scanning, and automatic recovery when the network drops.

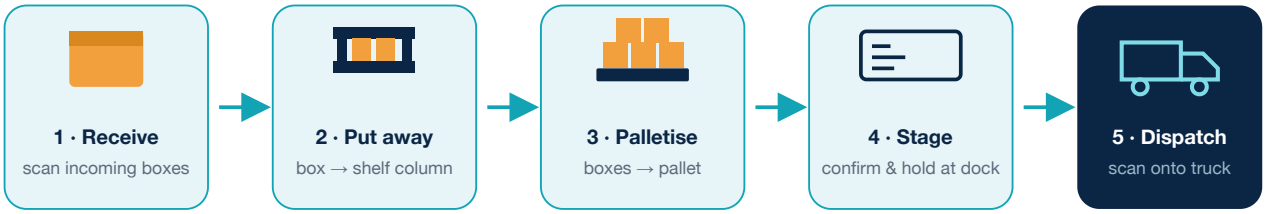

Warehouse worker home screen — one tap per activity

04 · WMS — WAREHOUSE

Every box accounted for, from dock to shelf

LIVE

The warehouse system tracks goods as physical units — individual boxes grouped onto pallets — using barcode scans rather than manual entry. Workers scan; the system does the book-keeping.

Each step is a barcode scan that updates the record instantly — no re-typing, no paper

Inside the warehouse — the lifecycle of a box

What it does

- **Seven scan activities** on the mobile app: Inbound, Outbound, Box Putaway, Convert to Pallet, Pallet Putaway, Pallet Consolidation, Confirm & Stage.
- **Format checks on every scan** — a wrong or unknown barcode is caught immediately, with an accept/decline choice.
- **Resumable sessions** — if a worker's phone dies mid-task, they pick up exactly where they left off.
- **Duplicate protection** — scanning the same box twice is flagged instantly.

Teams & control

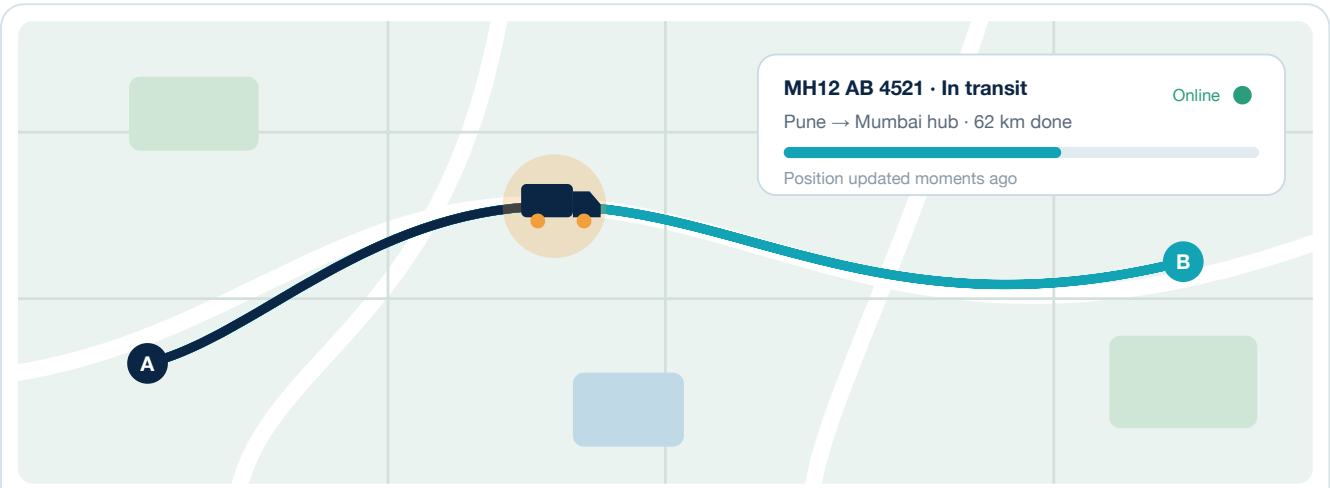

- Several managers per warehouse, each with their own team of workers.
- **Box enquiry** — scan any box to see its full journey and current status.
- Missing or mismatched boxes are raised as **exceptions** for a manager to resolve, not silently lost.
- Warehouses defined with standard state / district / pincode data for clean reporting.

05 · TMS — TRANSPORT

Every truck visible, every trip recorded

LIVE

The transport system manages the fleet, the drivers, and the trips between locations — and watches the vehicles in real time. No driver needs to press "start" or "stop": tracking is automatic.

Live route view — a truck's journey drawn from its GPS history (illustrative)

Fleet & drivers

Trucks and drivers belong to the organisation. A truck can only be assigned drivers and trips from its own company.

Trips & stops

A trip has a truck, a driver and one stop per destination. Status moves Planned → Loading → In transit → Completed.

Automatic arrival

Each location has a virtual boundary. When the truck leaves or arrives, the system records it — no manual check-in.

Always-on tracking from a truck-mounted phone

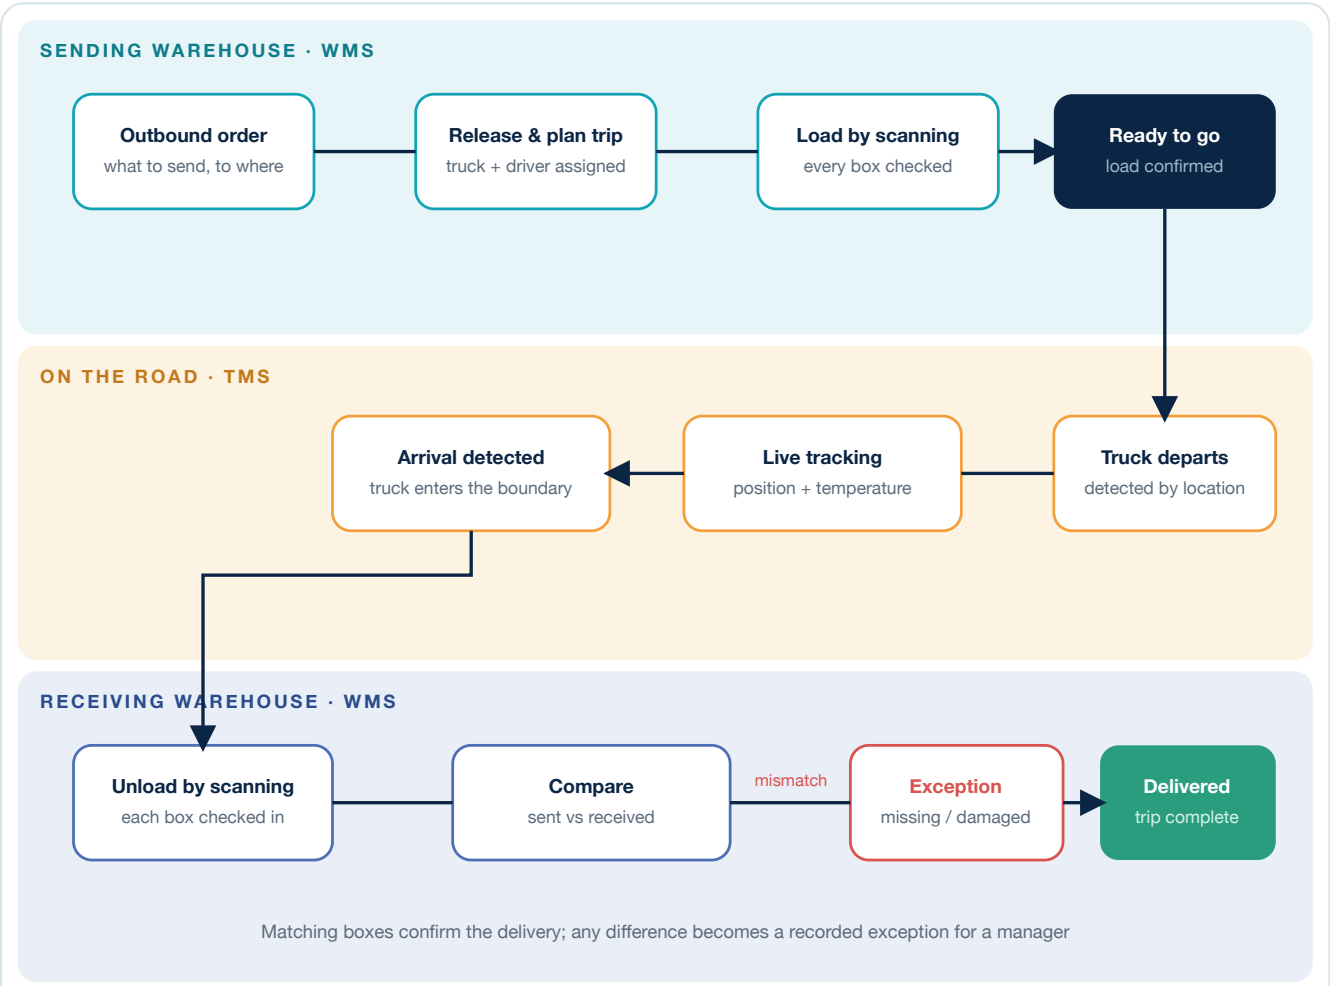

Instead of expensive custom hardware, a company phone is enrolled to **one truck** by an administrator and stays mounted there. It keeps recording when the driver changes, when the app is closed, and when there is no signal.

- **Moving** → position every ~15 seconds. **Parked** → every ~2 minutes to save battery.
- **Idle time and stops** are detected automatically and shown in the trip summary.
- **Works offline** — everything is stored on the phone first and uploaded when coverage returns.

06 · BETTER TOGETHER

How a box travels: warehouse to warehouse

When a customer has both systems, a warehouse dispatch turns into a truck trip automatically. The same scanned boxes are checked again on arrival, so any loss between the two buildings is detected.

End-to-end flow — warehouse, truck, warehouse

No blind spots

Goods are scanned at the dock, on the truck and at the destination — custody is never unknown.

No manual hand-over

Dispatch in the warehouse creates the trip for the dispatcher; no second data entry.

Disputes settled by data

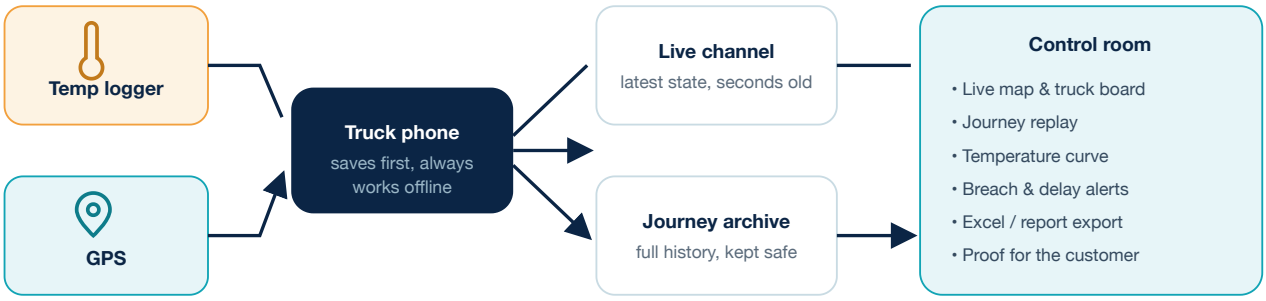

"Sent 100, received 98" becomes a recorded exception with the exact missing boxes.

07 · COLD-CHAIN MONITORING

Proof that it stayed cold

LOCATION LIVE TEMPERATURE NEXT

Each truck carries a phone that reports position today, and will also read a Bluetooth temperature logger placed in the load. Readings are captured from the start of loading to the end of unloading.

From the truck to the control room — data is never lost if the signal drops

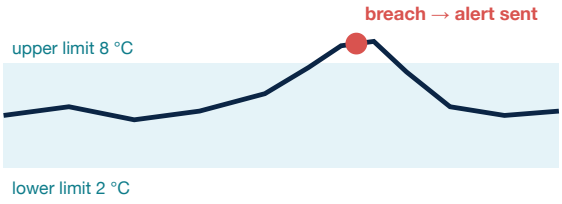

Two temperature classes

2–8 °C
Chilled
vaccines · medicines

10–30 °C
Controlled ambient
sensitive goods

Chosen per shipment at booking; one range per truck trip, so classes are never mixed.

Illustrative temperature trace

Time out of range, and how long, is recorded for each trip.

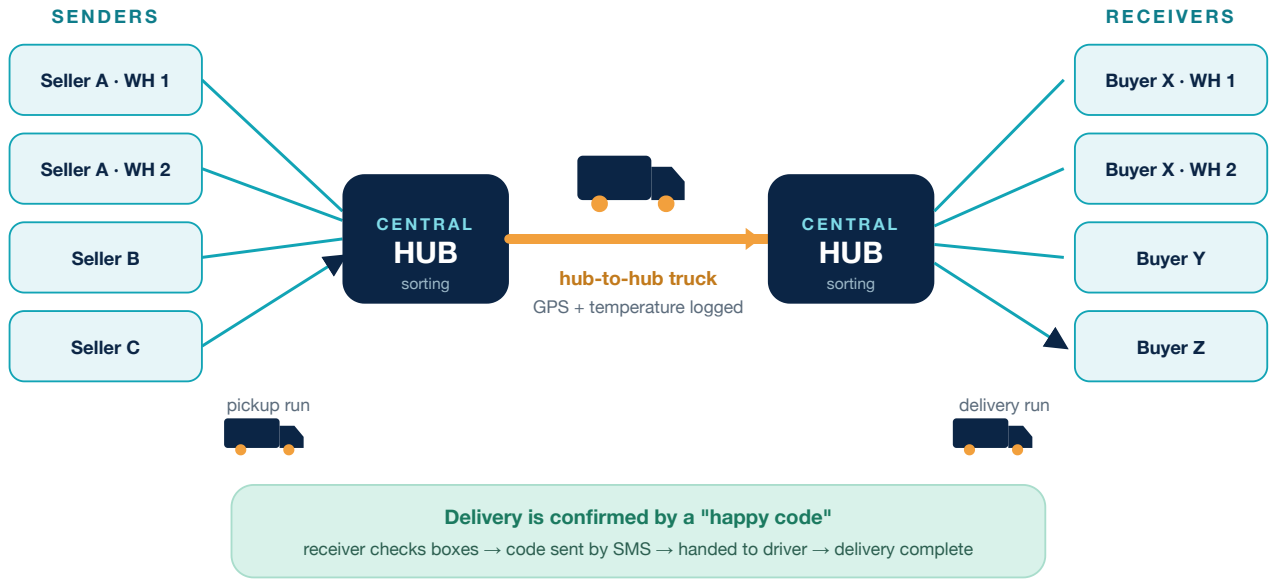

Who gets told: if temperature leaves its range, boxes go missing, or an express deadline is at risk, the alert reaches the driver, the sender, the receiver and the hub manager together.

08 · CNS — COURIER NETWORK

A cold-chain courier, hub to hub

NEXT · PILOT TARGETED DEC 2026

The next system turns the platform into a full courier network. A courier company runs central hubs and trucks; many senders hand over boxes and many receivers get them — all on one tracked, temperature-controlled chain.

Hub-and-spoke courier network — many senders, two hubs, many receivers

- **Always via two hubs** — consistent handling and one control point at each end.
- **Every hand-off scanned** — seller → pickup truck → hub → line-haul → hub → delivery truck → receiver.
- **Verified parties** — each seller and buyer is verified in person before they can transact.
- **Express & Normal** service, with deadlines and priority loading for express.
- **Receivers install nothing** — the happy code arrives by SMS.
- **Pilot first:** hub-to-hub movement goes live first; pickup and delivery follow.

09 · TRUST & RELIABILITY

Designed to be trusted with real goods

Logistics software runs in warehouses with weak signal and with people who have little time. LogiCore is built around that reality.

PRIVACY

Each customer is walled off

Every record belongs to one organisation. Rules enforced on the server — not just hidden in the screen — stop one customer ever seeing another's trucks, stock or people.

CONTROL

Sensitive actions go through the server

Creating users, moving stock or changing a trip's status is validated centrally, so a modified app cannot bypass the rules.

TRACEABILITY

Nothing is overwritten

Every scan, status change and approval is appended to a permanent history with who, when and where. Users are suspended, never deleted.

RESILIENCE

Works without signal

Scans and GPS are stored on the device first and replayed safely later — the same scan can never be counted twice.

Roles can only do what they should

Role	Sees	Can do
Organisation admin	Whole organisation	Set up warehouses, trucks, people; approve requests
Warehouse manager	Own warehouses & team	Run operations, resolve exceptions, request team members
Dispatcher	Trips & fleet	Plan trips, assign truck and driver
Warehouse worker	Own assigned tasks	Scan, put away, load, receive
Driver	Own trips	Run trip, confirm stops and deliveries

Where the technology stands

Web console
browser, any computer
admin & operations

Mobile app
Android & iPhone
workers & drivers

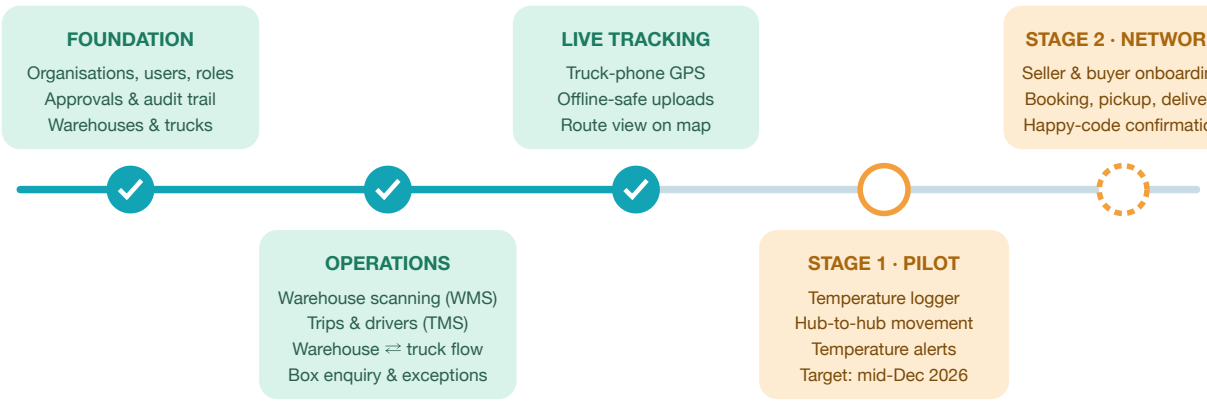

Secure cloud
Google Cloud platform
scales with usage

Live data
real-time positions
history kept for audit

10 · WHERE WE ARE

What exists today and what comes next

The platform is already working end to end for warehouse operations, trucks and live tracking. The courier network and temperature logging are the next stage.

Delivery path — green is working today, amber is the next build

Capability summary

Capability	Status	What it gives the customer
Organisations, users, approvals	WORKING	Secure multi-company setup with controlled onboarding
Warehouse system (WMS)	WORKING	Scan-based inbound, putaway, pallets, staging, outbound
Transport system (TMS)	WORKING	Fleet, drivers, trips, stops, automatic arrival
Truck GPS tracking	WORKING	Always-on location, idle detection, route replay
Orders & finance (OMS, ERP)	BUILT, HELD	Order approval, pricing and invoicing — ready to switch on when needed
Temperature monitoring	NEXT	Bluetooth logger readings, range checks, breach alerts
Courier network (CNS)	NEXT	Hubs, pickup, delivery, express, happy-code confirmation

In short: LogiCore is one platform that already runs warehouses, trucks and live tracking, and is extending into a full temperature-controlled courier network — with every box, truck and temperature on the record.
